

merge - Distribution over time - mean

merge - Distribution over time - avg\_shortest\_path\_length

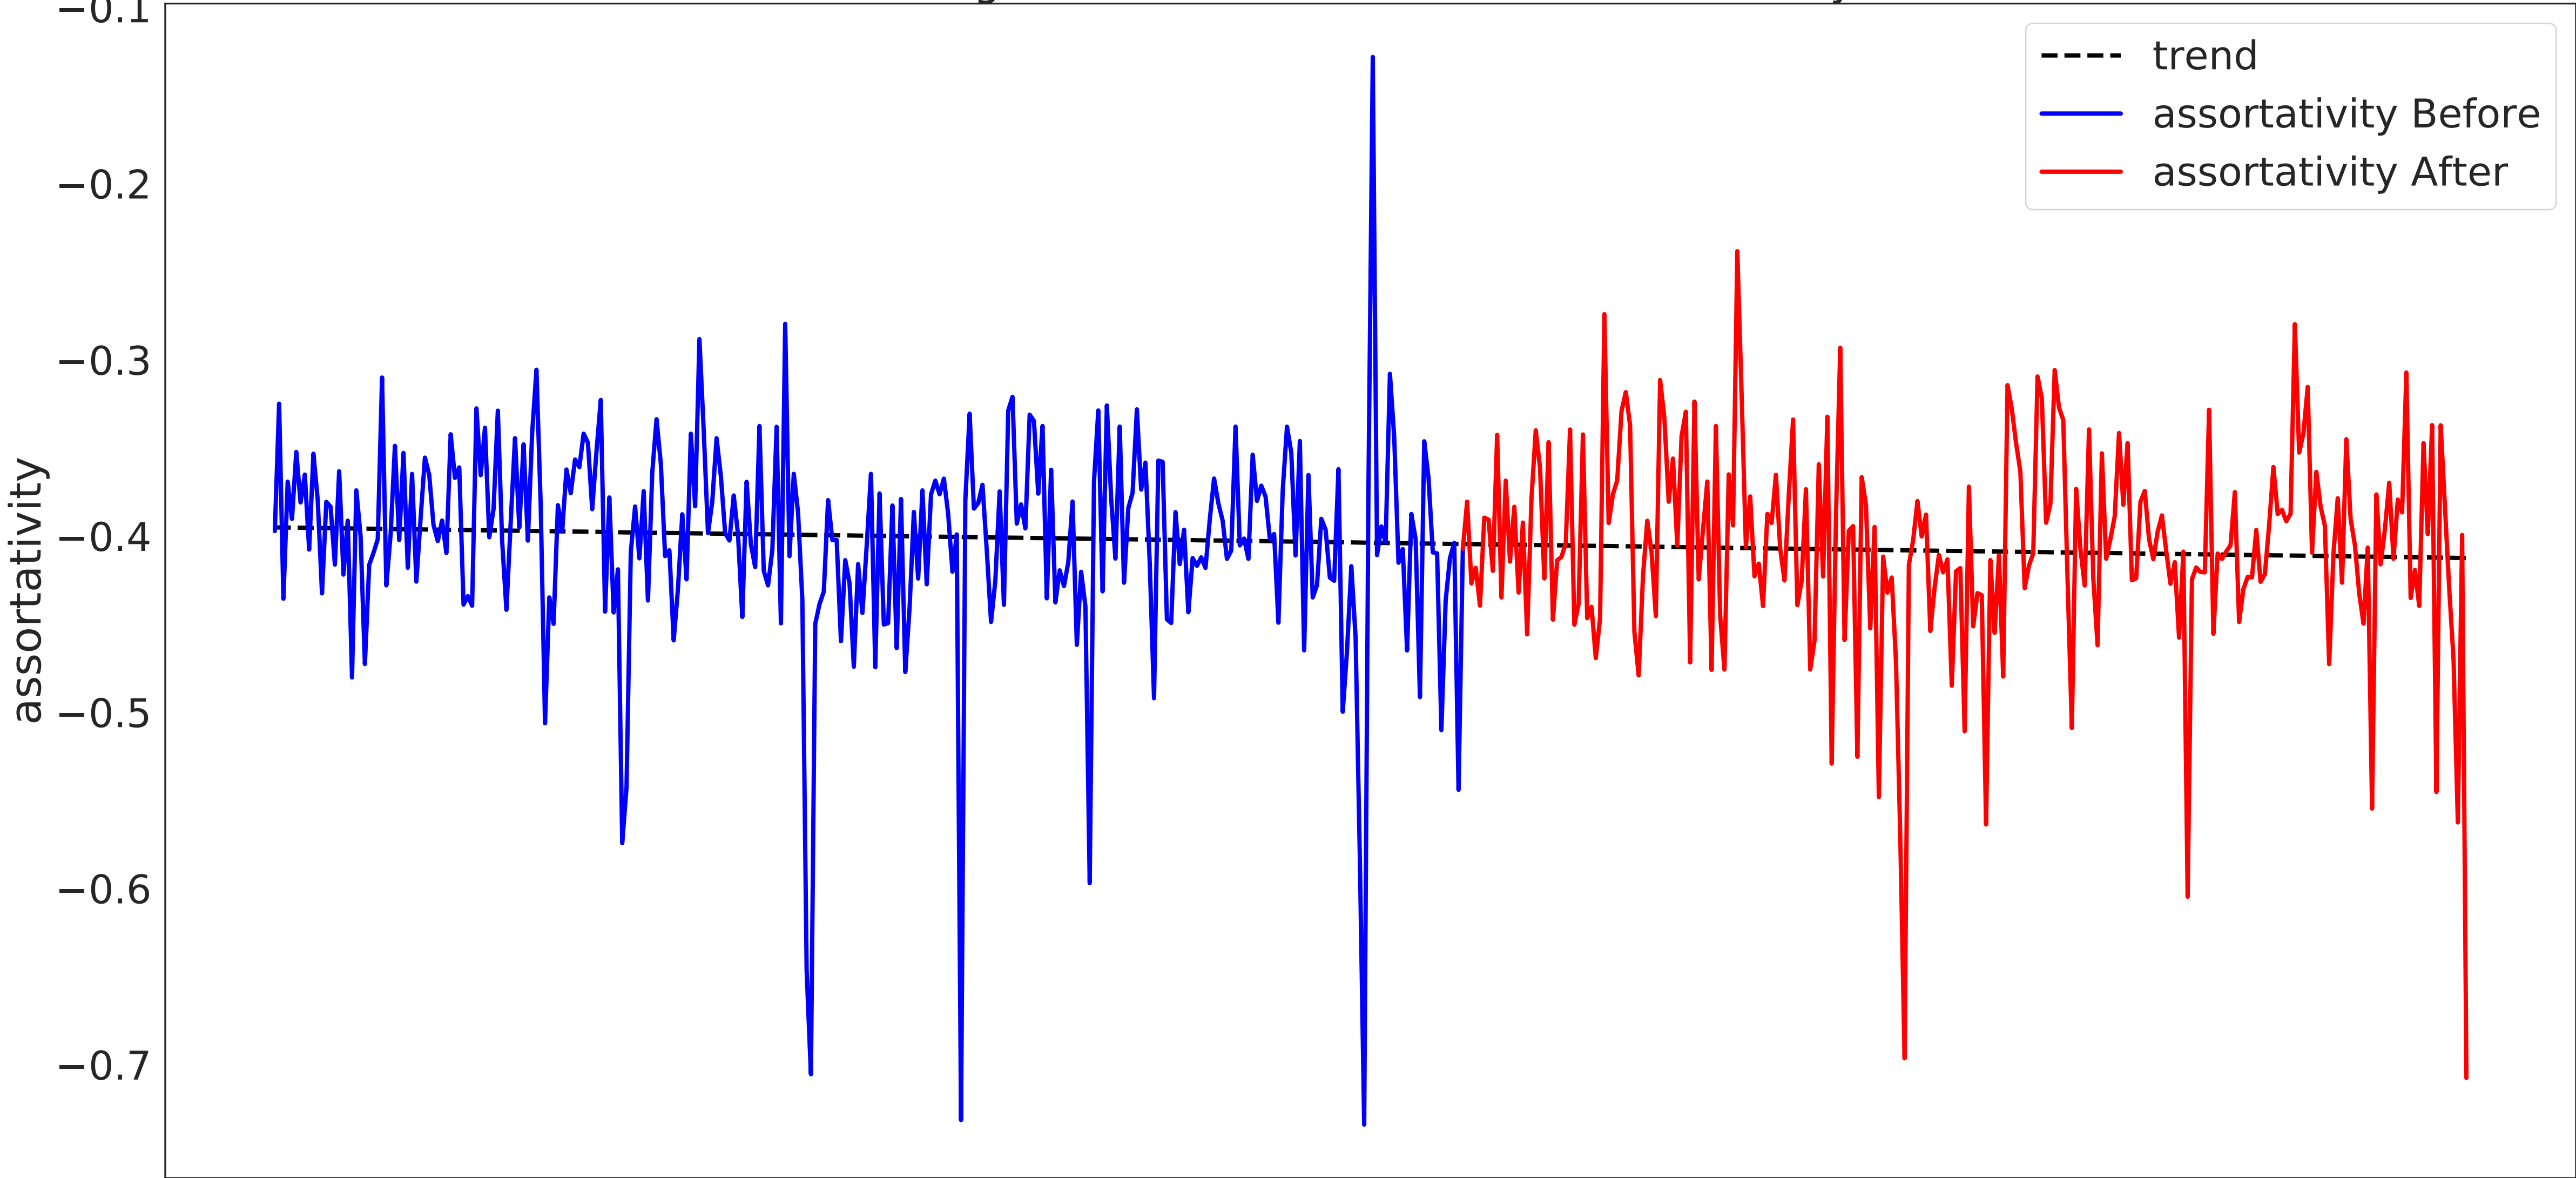

The graph displays two time series: 'transitivity Before' (blue line) and 'transitivity After' (red line). A dashed black line indicates the overall trend, which is relatively flat. The 'Before' period is characterized by significant fluctuations, including several sharp drops to low values. The 'After' period shows a more consistent and generally higher level of transitivity, with fewer extreme drops.
